

CONTROL OF LOOP LENGTH IN THE
PRODUCTION OF PLAIN KNIT FABRICS

A C K N O W L E D G E M E N T S.

I am extremely thankful to Mr. Bartnik, Knitting advisor of UNIDO/UNDP, Textile Training & Services Centre, Sri Lanka, for his overall supervision from the conception of this project to the completion, and the final product.

Dr. Lakdas D. Fernando, Head of the Department of Textile Technology University of Moratuwa was always an unforgettable guidance and direction, who paved the way towards gaining the required practical experience. The Chairman, Texvel Jersey Ltd., Mr. Rohana Fernando is fondly remembered for permitting the use of his workshops for this purpose.

The staff of the Textile Department of University of Moratuwa is also thanked with due gratitude. Mr. K.A.Eason Perera, who was my sincere colleague receives much credit for his invaluable brain-storming discussions which enlightened me on the subject.

Finally, I thank all those who helped in this exercise, in many many ways.

ABSTRACT

The important results obtained by previous workers, who were interested in the construction of plain knitted fabrics, have been critically analysed.

Several fabric samples with different loop lengths were examined so as to obtain further information and some relationships have been observed from the experimental values.

An attempt to disprove some misconceptions about w/cm and g/m^2 of plain knit fabrics has been made.

Finally a suggestion, helpful for further development of the project, has been brought forward.
