## ACKNOWLEDGEMENT

I wish to express my deepest gratitude to my supervisor Dr.K. P. Fernando and Dr(Mrs) L. Sivagurunathan the head of the Polymer Technology division, University of Moratuwa for the invaluable guidance, assistance and co- operation they extended to me throughout the period of this research project.

I am deeply indebted to my employer Sri Lanka Tyre Corporation for granting me leave of absence and providing me with facilities and finance to follow this course. At the same time I would like to mention the names of the late Prof.Patuwathawithana, former Managing Director, S.L.T.C. and Mr.D.Munaweera, Technical manager, S.L.T.C. without whose help and encouragement this opportunity of reading for the masters at the University of Moratuwa would have never been realised.

I also take this opportunity to place on record my appreciation and gratitude to Prof.P.A.D. Silva and Dr.A Induruwa for sparing their valuable computer hours on this exercise.

My special thanks are due to all individuals including Mr. C.W. Adams and Mr. A.D.S. de Silva, who extended their generous help and assistance to make this project a success.

My sincere thanks are due to my sister Iranganie, my friend Chandana and Mrs. M. Karunanayake for their invaluable support in clerical work.

## SYNOPSIS

The Finite Element method of structural analysis has achieved a rapid development within the tyre industry. This is basically due to the ability of dealing with complexities of modern tyres, which was the main obstacle earlier, which limited the applications and accuracy of the simpler models obtained through closed-form formulations. The advantage of the FEM is significant in its application to larger size tyres such as light truck and truck tyres.

In this report the FEM is described and applied in the stress analysis of a 7.50-16 light truck tyre, considering it as an axi-symmetric case. In supporting this three cases are considered and compared. These are namely,

- 
- University of Moratuwa, Sri Lanka.  
Electronic Theses & Dissertations  
www.lib.moratuwa.lk
- a) The inflated tyre without imposing any other modes of deformations.
  - b) The inflated tyre subjected to a foot print load
  - c) The inflated tyre at a bend carrying a dead load.

In analyzing the structure for the given tyre the parameters mentioned earlier are considered as the input data for the program. The language used in computing stress strain and displacements is FORTRAN 77 (Microsoft version 4.0)

## TABLE OF CONTENTS

	Pg. Nos.
Acknowledgements	i
Synopsis.	ii
Table of contents	iii
<b>CHAPTER 1</b>	
1.0 Introduction	1
1.1 History and development of the tyre	2
1.2 Tyre components.	4
1.3 Basic tyre designs.	6
1.4 Tyre functions and performance properties.	7
1.5 Stress-strain relationship of materials used in a tyre.	11
1.6 Objectives of the project.	12
<b>CHAPTER 2</b>	 <p style="margin: 0;">University of Moratuwa, Sri Lanka. Electronic Theses &amp; Dissertations <a href="http://www.lib.mrt.ac.lk">www.lib.mrt.ac.lk</a></p>
2.0 Introduction and Notations.	13
2.1 Introduction to the axi-symmetric case	16
2.2 Derivation of the element stiffness matrix.	18
2.2.1 Element geometry and choice of shape function.	18
2.2.2 Notations, sign convention and definition of strain.	20
2.2.3 Forces acting on the element.	23
2.2.4 Constitutive equations	25
2.3 Assembly of the overall stiffness matrix.	28
2.4 Method of Solution of the linear equations.	29
2.5 Boundary conditions.	31
2.5.1 Force boundary condition.	31
2.5.2 Displacement boundary condition.	33

2.6 The program.	34
2.6.1 The main program.	34
2.6.2 Subprogram for defining material properties.	38
2.6.3 Subprogram for defining temperature changes.	39
2.6.4 Subprogram for defining the body forces.	39
2.6.5 The mesh data output subprogram.	39
2.6.6 Subprogram for reading mesh data.	40
2.6.7 Subprogram for applying boundary conditions.	40
2.6.8 Subprogram for solving linear equations.	42

### CHAPTER 3

3.0 Results and discussion.	
3.1 Introduction.	44
3.2 Validity of the mathematical model.	47
3.3 CASE 1 - Analysis of the inflated tyre	53
3.3.1 Carcass behaviour.	53
3.3.2 Behaviour of the sidewall	60
3.3.3 Behaviour of the tread region.	68
3.3.4 Behaviour of grooves.	76
3.3.5 Behaviour of crown elements.	82
3.4 CASE 2 - Analysis of the inflated tyre subjected to foot print load.	87
3.4.1 Behaviour of the carcass.	87
3.4.2 Behaviour of the sidewall.	95
3.4.3 Behaviour of the tread region.	99
3.4.4 Behaviour of the grooves.	104
3.4.5 Behaviour of the crown elements.	110

3.5 CASE 3 -Analysis of tyre behaviour at a bend.	115
3.5.1 Behaviour of the carcass.	115
3.5.2 Behaviour of the sidewall.	123
3.5.3 Behaviour of the tread region.	128
3.5.4 Behaviour of the grooves.	133
3.5.5 Behaviour of the crown elements.	140
3.6 Suggestions for further works.	144
