Supervisor

Dr. SHP Gunawardena

ABSTRACT

There is an increasing demand for biodiesel, because of its environmental friendly nature and especially due to the depletion of petroleum reserves. Currently, most of the biodiesel is produced from edible oils under base catalyzed transesterification. However, large amount of non edible oils are underutilized and can be converted to biodiesel. The difficulty with base catalyzed transesterification of non edible oil is its higher content of free fatty acids. These free fatty acids react with base catalyst to produce soap and which prevent the separation of ester from the glycerin.

The reduction of free fatty acid content of rubber seed oil under catalyzed esterification with ultrasonic mixing (20 kHz, 500 W) was investigated in this study and compared with mechanical agitation. Batch esterification of rubber seed oil was carried out using 2.5:1 (w/w) methanol/ FFA and 0.05:1 (w/w) H₂SO₄/FFA and effect of ultrasound frequency, reaction temperature and reaction time were studied. With the increase of ultrasonic amplitude, mixing intensity was increased and as a result, maximum FFA% reduction of 88.9 observed at the amplitude of 75% and at a temperature of 55°C. When the esterification reaction carried out at elevated temperatures, it shows a greater reduction of FFA% under ultrasonic and mechanical mixing. However, optimum result was gained under mechanical mixing at the temperature of 55°C and at a reaction time of 30 min and the final FFA% of rubber seed oil was 2.75. At the same reaction conditions, acid esterification of rubber seed oil under ultrasonic mixing achieved a FFA% of 3.31.

Keywords: Biodiesel, FFA, esterification, ultrasonic mixing, Sri Lanka.

ACKNOWLEDGEMENT

It is a great pleasure to express gratitude to those who were behind me in completing my research successfully. First, I would like to offer grateful thanks to the supervisors Dr. (Mrs.) SHP Gunawardena and Dr. (Mrs) FM Ismail, Senior Lecturers, Department of Chemical & Process Engineering, University of Moratuwa who's guided and supervised me throughout the research beyond my perspectives. Then my sincere thanks are due to Dr. PG Rathnasiri and Dr. BAJK Premachandra, Senior Lecturers, Department of Chemical & Process Engineering, University of Moratuwa for their valuable comments, suggestions and the encouragement given.

I must specially thank Dr. ADUS Amarasinghe, Head of the Department, Department of Chemical & Process Engineering and all other lecturers of the Department of Chemical & Process Engineering, University of Moratuwa for the help given in various aspects.

All the staff of Chemistry, Food & Microbiology, Latex Technology and Energy Engineering laboratories, specially Mr. Masakorala, Mr.Lalith and Ms. Amali Wahalathanthri, are gratefully acknowledged for their support given in various occasions.

Finally I would like to thank all the colleagues of the PG Division of the Department of Chemical & Process Engineering and my family, for the help and cooperation given.
