January 2015

Declaration

I declare that this is my own work and this dissertation does not incorporate without acknowledgement any material previously submitted for a Degree or Diploma in any other University or institute of higher learning and to the best of my knowledge and belief it does not contain any material previously published or written by another person except where the acknowledgement is made in the text.

Also, I hereby grant to University of Moratuwa the non-exclusive right to reproduce and distribute my dissertation, in whole or in part in print, electronic or other medium. I retain the right to use this content in whole or part in future works (such as articles or books).

Date:

The above candidate has carried out research for the Masters Dissertation under my supervision.

Signature of the supervisor:

Date:

Dr. Lidula N. Widanagama Arachchige

Acknowledgement

I wish to express my sincere gratitude and appreciation to my research project supervisor, Dr. Lidula N. Widanagama Arachchige for her continuous guidance and immense support given.

I would like to convey my sincere gratitude to Mr. WLSK Wijethunga, Chief Engineer-Projects & Heavy Maintenance, Distribution Division-2 of Ceylon Electricity Board (CEB), who encouraged me continuously to complete this successfully.

I would like to thank Mr. NABR Wijayawardhana, Electrical Engineer, Projects and Heavy Maintenance Branch, Distribution Division-2 of CEB and Mr. Hirantha Jayathilaka, Area Engineer, Mawanella of CEB for the support given me at various stages of the project.

I thank the staff of Projects & Heavy Maintenance Branch and Planning Division, Distribution Division-2 of Ceylon Electricity Board for the support given in providing necessary information for the project.

Last but not the least, I would like to express my heartiest gratitude and love to my parents, my son Dinuth and wife Asanthika, who took a lot of burden and patience, helping me to complete this work in difficult circumstances.

Abstract

Conventional distribution system is generally passive, which means power flow is unidirectional, from its grid substation to the loads. With addition of Distributed Generation (DG) in to the system, several issues, such as power flow bi-directionality and increase of fault current in the system influence the existing protection scheme, which is originally designed for a passive network, which has limitations. Protection issue may become a crucial factor and more attention is required in designing the protection system at increased DG penetration levels. If it is possible to calculate loss of protection coordination quantitatively, utility can clearly identify the measures to be taken on their protection system in advance.

The objective of this research study is to introduce a technique, which can be used to assess the protection coordination loss quantitatively, for a DG integrated network. Study is focused on the typical Medium Voltage (MV) network, mainly 33 kV and 11 kV in Sri Lanka. MV distribution system of Mawanella area of Ceylon Electricity Board (CEB), Sri Lanka is selected for the case study where, a total capacity of 6.4 MW of mini-hydro plants is integrated to the system.

Fault current contribution to the system heavily depends on DG type, capacity and location. The effect of these decisive factors on the protection system is analyzed using the Power World Simulator. A tabulation method is used to record the data. Based on the table, decision on protection coordination loss in the system is segregated, protection coordination is maintained or not. Using the segregated data, protection coordination loss percentage is presented to get an overall idea for the system.

The proposed technique can be used to analyze the loss of protection coordination quantitatively for existing networks where DGs are already in operation. The same can also be used as a powerful tool at planning stage at the time of studying new DG proposals. The proposed technique can be integrated as a new dimension to the currently practicing tools of over voltage check and short circuit capacity check.

Key words – Distributed Generation, Protection Coordination, Protection Coordination loss, Distribution System Planning, Fault Level
