## Abstract

With the rapid development in industrial sector in Sri Lanka, there is a high demand for clear span buildings to cater for the factories with advance technology production lines as well as for the warehouses. Structural steel buildings are the best economical solution among different types of construction materials for such buildings. Portal frame is the best solution for large clear spans and is the most popular structural form used in the construction industry. It offers an economical solution to medium to large spans and the most important feature is the saving on construction time which is a main concerns of most the clients. However, to get the optimum solution in steel portal frames there are several key factors to consider during the design stage.

Main frame spacing, roof slope and type of roof covering material are some of the key parameters which will have an effect on the optimum frame design. In order to show the effect of the above parameters in steel portal frame designs a series of frame analysis was carried out in this study and several conclusions were made to assist steel designers. It is assumed that the reader has some basic knowledge of steel portal frame design and these results will provide further useful guidelines for design of an optimum steel portal frame for a given span within a shorter period.

*A Thesis submitted for the partial fulfillment  
Of the Degree of Master of Engineering in  
Structural Engineering Design.  
Year 2002*

## Acknowledgements

My sincere thanks to the project supervisors Dr. (Mrs.) M. P. T. Hettiarachchi and Dr. A .D. C. Jayanandana for devoting their valuable time in guiding me and the encouragement given to me to complete this research study. It is now doubt that with out their interest and guidance this would not been a success.

I wish to thank the Vice Chancellor, Dean of the Faculty of Engineering and Head of the Department of Civil Engineering for the allowing me to use the facilities available at the University of Moratuwa.

I am grateful to the Project Engineering Co. Ltd. Managing director and the management for the assistance given to me to follow this master degree course, allow to use their properties and to collect relevant information. It is no doubt that without their support this would not been a success.

Finally I would like to dedicate this hard work to my parents, wife Wishwa, my san Pasindu and daughter Hiruni for their enormous support and encouragement.

K.L.P.D.Perera.
