ABSTRACT

Traffic management in main cities has become an absolute need due to the increase in the number of vehicles in the limited road space, at present. There are numerous limitations that restrict the widening of roads to cater to the demand of the ever-increasing vehicular load in an already congested city such as Colombo. The question is how are we going to differentiate between the benefit and the cost of development. It is very important to look for cost effective methods by minimizing the adverse effects on the economy in a developing country like Sri Lanka.

The objective of this research was to check the suitability of a One-way traffic system in a selected area of the Colombo City. The most congested areas, which could be expanded later, depending on the results obtained, have been selected first. The study area was confined to Northern and Southern banks of Beira Lake in Colombo Fort area. Computer software developed by Transportation Engineering Division, Department of Civil Engineering of University of Moratuwa called 'Transplan' was used for the analysis of data. This is still in the developing stage, but has been observed to have been used accurately by comparing actual data at the site. However, 'Transplan' has greatly reduced the amount of time required for calculation. There are other researches that are being carried out to study the suitability of Bus Lanes and Light Rail Transit (LRT), both of which require additional road space in the existing road network. This requirement could be met with a One-way traffic system, which increases the capacity in those road links. Traffic management measures such as integrated signalling systems, tidal flow operation etc, also have to be implemented in parallel with a one-way traffic system to have optimum benefits. Any of the above researches accrues benefits to the transport sector development resulting in large economic gains to the country, indeed.

However, it is high time we explored the feasibility of implementing accurate traffic management systems that can relieve the congestion level in busy business cities. One-way traffic systems are operating in most developed countries quite effectively at present.

Very soon, we will have to select a One-way traffic system as a traffic management option in the Colombo City, as it is the most convenient alternative in the prevailing situation.

ACKNOWLEDGMENT

I wish to thank most sincerely Prof. Amal Kumarage, the Supervisor and Dr. Saman Bandara, Senior Lecturer, for their valuable support and guidance extended so generously to me, throughout the study. Despite their busy schedules, both Prof. Amal Kumarage and Dr. Saman Bandara found time, particularly when I was desperately in need of assistance, to sort out quite a number of difficult issues in my study and produce the Study Report in its final form.

I also take this opportunity to express my gratitude to my employer, Eng. M.G.C.P Wijethilake Director (Technical Services), Resources Development Consultants Limited for providing me the facilities to follow this course amidst tight work schedules. The experience gained, parallel to the course in the same field under the guidance of Eng. R.G.Rajapakse is greatly appreciated. Also I express my gratitude to Eng. Burney Wijesuriya and Mr. G.H.A Perera for assisting me in making corrections in the text of the thesis.

I am thankful to the Traffic Laboratory Staff, Department of Civil Engineering who helped me in many ways to carry out a successful research. My special thanks are due to Ms Predeepa Jayaratne in this regard.

Finally, I thank my beloved wife Sala for all her moral support and tolerance that shone as a beacon throughout the long period of two years of my graduate study and preparation of this Report.

Contents	iv
List of Figures	vi
List of Tables	vii
List of Abbreviations	viii
Chapter 1 - INTRODUCTION	01
Chapter 2 - PRESENT SITUATION OF THE ROAD SYSTEM	04
2.1 Existing road network in the city	04
2.2 Selection of area	06
2.3 Methodology of Network Identification	07
Chapter 3 - THEORY RELATED TO ONE-WAY TRAFFIC	10
3.1 One-way and Tidal Flow Operations	10
3.2 Properties of a One-way traffic system	12
3.3 Effect at intersections	15
Chapter 4 - METHODOLOGY	18
4.1 One-way Loops in Selected Area	18
4.2. Data Collection	19
4.2.1 Traffic Data Collection	20
4.2.2 Road Sectional Properties	20
4.2.3 Socio Economic Data Collection	23
4.2.4 Other Data	24
4.3 Procedure for Analysis	24
Chapter 5 - DATA ANALYSIS	27
5.1 One-way Road Network	27
5.2 Calculations Using Transplan	29
5.3 Comparison of a Two way and a One-way system	30

5.4	Vehicle Kilometres and Hours Savings (One-way against Two-way)	30
5.4.1	Individual Combinations	30
5.4.2	Cumulative Combinations	35
5.5	Change of increased daily Vehicle Volumes	38
5.6	Optimum Loop Combinations	42
5.7	Improvements to LOS in Selected area for One-way	46
5.8	Further LOS improvements by adopting civil cost	49
5.9	Improvements to Intersections and Junctions of one-way system	54
 Chapter 6 - ECONOMIC COST AND BENEFITS OF THE PROJECT		 59
6.1	Cost Component of the Project	59
6.2	Benefit Calculations	61
6.2.1	Savings in Travel Time	61
6.2.1.1	Passenger Travel Time Savings	62
6.2.1.2	Travel Time Savings to Freight Consignees	64
6.2.2	Savings in Fuel	68
6.2.3	Savings in Emissions	70
6.2.4	Vehicle Operating Cost Savings	72
6.2.5	Accident Cost Savings	73
 Chapter 7 - ECONOMIC APPRAISAL OF THE PROJECT		 78
7.1	Net Present Value of benefits	78
7.2	Net Benefits	79
7.3	Benefit Cost Ratio	80
7.4	Economic Internal Rate of Return	80
