MOTORCYCLE ACCIDENT ANALYSIS IN SRI LANKA

Sulaima Labbie Ahamed Shajith

(148315V)

Thesis submitted in partial fulfillment of the requirements for the degree
Master of Engineering in Highway & Traffic Engineering

Department of Civil Engineering

University of Moratuwa
Sri Lanka

June 2018

DECLARATION

I declare that this is my own work and this thesis does not incorporate without acknowledgement any material previously submitted for a degree or diploma in any other university or institute of higher learning and to the best of my knowledge and believe it does not contain any material previously published or written by another person except where the acknowledgement is made in the text.

Also, I hereby grant to University of Moratuwa the non-exclusive right to reproduce and distribute my thesis / dissertation, in whole or in part in print, electronic or other medium. I retain the right to use this content in whole or part in future works (such as articles or books).

ABSTRACT

Motorcycles comprise nearly 30% of the traffic flow in most highways in Sri Lanka. The rapid increase in motorcycle usage has led to a significant increase in the number of motorcycle related accidents and fatalities. The objective of this study is to identify the risk factors involved in motorcycle accidents.

In this study, Motorcycle related accidents data were analyzed under four categories. Such as, Motorcycle accident with motor vehicles, pedestrian, cyclist and self-accidents. Risk to motorcyclist with respect different types of vehicles also estimated. Other than descriptive statistics, the stepwise binary logistics regression was selected to be used in analyzing accidents.

Motorcycle related accidents accounts for nearly 40% of total road accidents. Motorcyclist in Sri Lanka face approximately 1.60 times more fatal risk compare to motorcyclists all over the world. Motorcycle accidents with Lorries and Buses have more chance to become fatal compare with other vehicles.

Nearly 29% of the pedestrian fatalities and 9% of cyclist fatalities involved motorcycles. Furthermore, pedestrians - motorcycle fatal accidents were at greatest risk at mid block sections of the road and pedestrian aged 60 above were at the highest risk of suffering a fatality during a motorcycle accident compared to other age groups.

For single vehicle accidents, more than 57% of accidents occur during the night time and the risk ratio increase by over 20% during the night time on road segments without street lightings.

Involvement of younger riders in accidents are high and fatal risk to riders increase with their age. The study also evaluates other risk factors associated with motorcycle related accidents. Findings of the study would be useful to identify appropriate measures to improve the motorcycle rider safety in Sri Lanka.

Keywords: Accident analysis, Motorcycle, road safety, risk analysis

ACKNOWLEDGEMENT

The author is immensely grateful to the supervisor, Dr.H.R.Pasindu of the Department of Civil Engineering for his invaluable guidance and support throughout the research work.

I would like to express my sincere gratitude to, A.L.M.Nizar (Provincial Director, Road Development Authority), M.B.Aliyar (Chief Engineer, Road Development Authority) and M.K.Ranatunga (Officer In charge, Traffic Branch, Police Station, Akkaraipattu) for their support to carry out my research successfully.

Further, I would like to thank to my colleagues A.L.R.Ahamed (Engineer, Ceylon Electricity Board), M.I.A.Sajeer (Engineer, Road Development Authority) and A.H.M.S.Sharic (Lecturer, Sir John Kotelawala Defense University) for their continues support, encouragement and comments given throughout the research work. The support given by Mrs. Chathuri in all official matters is appreciable.

Finally, I extend my kind appreciations and sincere gratitude to my parents, wife, children and other family members for their support, sacrifices and patient throughout the journey.
