DECLARATION

I declare that this is my own work and this thesis does not incorporate without acknowledgement any material previously submitted for a Degree or Diploma in any other University or institute of higher learning and to the best of my knowledge and belief it does not contain any material previously published or written by another person except where the acknowledgement is made in the text.

Also, I hereby grant to University of Moratuwa the non-exclusive right to reproduce and distribute my thesis, in whole or in part in print, electronic or other medium. I retain the right to use this content in whole or part in future works (such as articles or books).

ABSTRACT

This research evaluates possibility of using a new hybrid system based on variable speed diesel generator (VSDG), Li-ion battery bank and supercapacitor bank (SC) for a rubber tire gantry crane (RTGC) used in container terminals. Existing commercial hybrid systems face difficulties producing high efficiencies, higher life span and lower initial investment cost due to inheriting characteristics of batteries and supercapacitors. In the proposed power system, a variable speed diesel generator act as the principal energy source, while a Li-ion battery bank and SC bank act as an energy storage system. The battery supports the diesel generator during steady demand and further, it absorbs a part of energy during regeneration. The energy management strategy controls the power flow from different sources while maintaining battery SOC level within a narrow band. Unlike most battery systems, this narrow band operation of battery system increases its life span while reducing capacity fade. The originality of this study can be emphasized from this narrow band SOC control technique. Simulation results for real operational load cycles are presented showing a stable system operating under defined current limits which can enhance lifetime of battery system and increase fuel saving by downsizing 400kW constant speed diesel generator to 200kW VSDG.

Keywords— RTG cranes, Hybrid energy storage, Energy management, narrow SOC band

ACKNOWLEDGEMENT

I would like to thank my supervisor Dr D. P. Chandima of Department of Electrical Engineering at University of Moratuwa for accepting my proposal for the research. Under his direction, I was awarded full freedom to steer the research, but guide me in the right direction whenever he thought I needed it.

During research, I learned a lot more than designing systems and hybrid applications. Actually, modeling complex systems in simulation environment is much harder and I gained much knowledge about Matlab and Simulink which I never had chance during my graduate period.

I like to specially thank to University of Moratuwa for the financial support under Senate Research Committee (SRC) Grant scheme. Moreover, a special word of thanks is meant for my family for supporting me and encouraging me through the period. I would like to extend my gratitude for all research colleagues in Department of Electrical Engineering who helped me and motivated me during the research.
