Abstract

In Sri Lanka, nearshore wave climate is influenced by the simultaneous occurrence of swell waves approaching from a more or less southerly direction and sea waves mainly influenced by monsoonal weather pattern. Some nearshore areas are also vulnerable for occasional impact of cyclonic wave conditions. This complexity and high degree of temporal and spatial variability of waves clearly emphasize the need for accurate assessment of near shore wave climate.

The lack of wave recordings at nearshore location restricts the assessment of nearshore wave climate to some extent. This deficiency in wave data can be overcome by transforming waves from location at which wave data are available through wave propagation modelling. This research study is aimed to develop two dimensional mathematical model based on an irregular wave description capable of simulating wave propagation from offshore to nearshore considering wave transformations due to shoaling, refraction, wave breaking and bottom friction dissipation. The wave conservation equation and the model of Battjes and Janssen were used as the basis to develop the model.

Galle (70m depth) is considered as offshore location which represents the entire deep water wave climate off the southern offshore coast. Hambantota (17m depth) and Kudawella (15m depth) were selected as nearshore locations to establish the directional wavestatistics for swell and sea waves by applying the developed mathematical model.

Finally based on obtained nearshore wave data base, predictions for extreme wave conditions were made as design wave parameters for coastal and harbour structures. Extremewave heights analysis were done for both offshore and nearshore locations in southern coast of Sri Lanka using two statistical extreme value probability distributions, namely Gumbel (Fischer-Tippet Type 1) distribution and the Weibull distribution

<i>Abstract</i>	<i>x</i>
Chapter 1	
1.0 INTRODUCTION	001
1.1 Background	001
1.2 Scope of the Study	002
1.3 Objectives	002
Chapter 2	
2.0 COASTAL ENVIRONMENT	004
2.1 Coastal Zone	004
2.2 Types of Fluid Motions in Sea	007
2.2.1 Tides	007
2.2.2 Waves	007
2.2.3 Currents	008
2.2.4 Storm Surges	009
2.2.5 Tsunamis	009
Chapter 3	
3.0 WAVE CHARACTERISTICS	011
3.1 Wave Generation	011
3.2 Regular Waves	012
3.2.1 Small Amplitude Wave Theory	012
3.2.2 Higher Order Wave Theories	014
3.3 Transformation of Irregular Waves	015
3.3.1 Wave Shoaling	016
3.3.2 Wave Refraction	017
3.3.3 Wave Diffraction	018
3.3.4 Wave Reflection	019
3.3.5 Wave Decay due to Bottom Friction	019
3.3.6 Wave Breaking	020
3.4 Irregular Waves	024
3.4.1 Irregular Waves in Deep Water	024
3.4.2 Irregular Waves in Shallow Water	026
Chapter 4	
4.0 LITERATURE REVIEW	028
4.1 Wave Propagation Models	028
4.1.1 Simple Models	029
4.1.2 Complex Models	031

4.2 Review of Available wave data	034
4.2.1 General	034
4.2.2 Wave Measurements	034
Chapter 5	
5.0 MATHEMATICAL MODEL FOR WAVE PROPAGATION	037
5.1 Basic Approach	037
5.1.1 The wave conservation equation	037
5.1.2 The model of Battjes & Janssen	039
5.2 Mathematical model	041
5.2.1 Introduction	041
5.2.2 Input data for the model	042
5.2.3 Output data from the model	042
5.2.4 Computational steps in the numerical Scheme	042
5.3 Limitations	044
Chapter 6	
6.0 APPLICATION OF THE MODEL	045
6.1 Wave transformation	045
6.2 Selected locations	046
6.3 Assessment of offshore wave climate	046
6.4 Model setup	048
6.5 Wave transformation matrices	049
6.6 Assessment of nearshore wave climate	056
6.7.1 Hambantota	056
6.7.2 Kudawella	075
6.7 Extreme wave height analysis	094
6.7.1 Extreme wave height at offshore	097
6.7.2 Extreme wave height at nearshore	100
Chapter 7	
7.0 RESULTS & DISSCUSSION	111
7.1 Offshore Wave Climate	111
7.2 Nearshore Wave Climate	113
7.2.1 Hambantota	113
7.2.2 Kudawella	116
7.3 Comparison of Results	119
Chapter 8	
8.0 CONCLUSION & RECOMMENDATIONS	123
8.1 Conclusion	123
8.1.1 Application of Mathematical Model	123
8.1.2 Offshore Wave Climate	123
8.1.3 Nearshore Wave Climate	123
8.2 Recommendations	124

Acknowledgement

I would like to express my deepest gratitude to **Dr P. P. Guneratna**, Senior Lecturer, Department of Civil Engineering, University of Moratuwa, supervisor of the project for his guidance and encouragement towards the successfully completion of the project from the time of beginning. Without his constructive ideas and feedback throughout the project I would not have succeeded.

My appreciation is also extended to the Chairman of the Research Progress Review Committee of the project **Dr. K. Raveenthiran**, Senior Research Engineer, Lanka Hydraulic Institute Ltd for his constructive comments and guidance.

I convey my appreciation to Senior Lecturer, Department of Civil Engineering, **Dr. S.P. Samarawickrama** acting as a Committee member for my MSc. Research Progress Review Committee and reacting positively for all necessary requests

My gratitude also goes to **Prof. S.A.S. Kulathilake**, Senior Lecturer, Department of Civil Engineering as the research Co-ordinator specially allocating his time to attend progress review proceedings.

I also thank **Senate Research Committee** for funding the research.

With a special consideration, I would like to thank my all colleagues including **Ms. W.C.D.K. Fernando**, **Ms. E. K. Champika** for their fullest corporation.

Credit must be given to the technical staff in Hydraulic Engineering Laboratory headed by **Mr. H.W Kumarasinghe** and **Mr A.A.D.I.A. Jayawardhana** for their kind support

I wish to thank all the **academic and non academic staff members** in Department of Civil Engineering, University of Moratuwa for their support.

Finally I'm indebted to a number of persons who helped me in numerous ways towards successful completion of this project and I thank them all.

Abstract

In Sri Lanka, nearshore wave climate is influenced by the simultaneous occurrence of swell waves approaching from a more or less southerly direction and sea waves mainly influenced by monsoonal weather pattern. Some nearshore areas are also vulnerable for occasional impact of cyclonic wave conditions. This complexity and high degree of temporal and spatial variability of waves clearly emphasize the need for accurate assessment of nearshore wave climate.

The lack of wave recordings at nearshore location restricts the assessment of nearshore wave climate to some extent. This deficiency in wave data can be overcome by transforming waves from location at which wave data are available through wave propagation modelling. This research study is aimed to develop two dimensional mathematical model based on an irregular wave description capable of simulating wave propagation from offshore to nearshore considering wave transformations due to shoaling, refraction, wave breaking and bottom friction dissipation. The wave conservation equation and the model of Battjes and Janssen were used as the basis to develop the model.

Galle (70m depth) is considered as offshore location which represents the entire deep water wave climate off the southern offshore coast. Hambantota (17m depth) and Kudawella (15m depth) were selected as nearshore locations to establish the directional wave statistics for swell and sea waves by applying the developed mathematical model.

Finally based on obtained nearshore wave data base, predictions for extreme wave conditions were made as design wave parameters for coastal and harbour structures. Extreme wave heights analysis were done for both offshore and nearshore locations in southern coast of Sri Lanka using two statistical extreme value probability distributions, namely Gumbel (Fischer-Tippet Type 1) distribution and the Weibull distribution
