DECLARATION OF THE CANDIDATE AND SUPERVISOR

I declare that this is my own work and this thesis does not incorporate without acknowledgment any material previously submitted for a Degree or Diploma in any other University or institute of higher learning and to the best of my knowledge and belief it does not contain any material previously published or written by another person except where the acknowledgment is made in the text.

Also, I hereby grant to the University of Moratuwa the non-exclusive right to reproduce and distribute my thesis/dissertation, in whole or in part in print, electronic or other media. I retain the right to use this content in whole or part in future works (such as articles or books).

Signature:

Date:

The above candidate has carried out research for the Masters/MPhil/Ph.D. thesis/dissertation under my supervision.

Signature of the supervisor:

Date:

ACKNOWLEDGMENT

I am grateful to take this opportunity to thank all who guided and supported me so far to achieve this research fulfillment.

I would like to express my deepest gratitude to my supervisor, Prof. R. L. H. L. Rajapakse for his unreserved support, instructions, and motivation throughout the period to complete this research successfully.

I wish to forward my sincere thanks to the Head of the Department of Civil Engineering, Prof. S. A. S. Kulathilaka, and Lecturer in charge of Research Methods for Water Resources Planning and Management, Prof. N. T. S. Wijesekera for their support to successfully accomplish the Master's program. I would like to add my gratitude to Prof. (Mrs.) J. C. P. H. Gamage, and Dr. P. K. C. De Silva for constructive feedbacks during progress reviews.

I would also like to thank the South Asia Foundation (SAF), UNESCO Madanjeet Singh Centre for South Asia Water Management (UMCSAWM), and the University of Moratuwa for the opportunity to take on this Master's program at UNESCO Madanjeet Singh Centre for South Asia Water Management (UMCSAWM), Department of Civil Engineering, University of Moratuwa.

I would like to appreciate the provision of necessary data for the research by the Department of Meteorology, Irrigation Department, and National Water Supply and Drainage Board (NWSDB).

I would also like to appreciate the immense support by the staff of the Department of Civil Engineering, University of Moratuwa.

Lastly, my heartfelt gratitude goes to my parents and my friends for their continuous support and inspiration to me to achieve this successfully.

Effect of Climatic Change on Water - Energy - Food Nexus in Mahaweli River Basin and a Prediction Model to Mitigate Negative Impacts

Abstract

Mahaweli river is the longest river in Sri Lanka which flows through all the climatological regions with vast diversities in precipitations, environmental conditions, water usages, and livelihoods. The hydrology of the sub-basins in the Mahaweli river varies from high frequent and high-intensity rainfalls in wet zones to water-scarce dry zones. Identification of climatic impacts and analysis of proactive management alternatives are important in optimizing water management in a watershed. For the selection of efficient proactive water management alternatives, integrated management of the water allocations to satisfy water demand in different sectors has to be identified. The WEF nexus models were developed as the integrated management approach for water allocations. The objective of this study is to develop the WEF nexus with prediction models for subbasins of the Mahaweli River and analyze the climatic change. Three sub-basins were selected from the different climatic zones to analyze the climatic effect on water management. RNN NARX model was identified as the most suitable model from the comparison of accuracy in prediction between linear ARIMA model and non-linear NARX model. Monthly water availability and water demand for water and food sectors of the WEF nexus were calculated using rainfall, potential evapotranspiration, streamflow, land use, and water use data. The NARX prediction models for available water and requirements were developed and intersectoral WEF nexus analysis was carried out for different proactive management alternatives. Available water in the wet and intermediated zones was adequate to supply the water requirements in the sub-basins. The average water availability of the dry zone basin is about 39.97 MCM/month while the water requirement is about 61.50 MCM/month. Available water was inadequate to fulfill water requirements in the dry zone basin for some months. Prediction models combined with WEF nexus analysis are an improved decision support system for water management as it is advantageous to know possible threats for fulfilling the water requirements beforehand and to mitigate negative impacts accordingly.

Keywords: Climatic impact, Decision support system, Intersectoral analysis, NARX, Prediction models, WEF nexus.
