## DECLARATION

“I certify that this thesis does not incorporate, without acknowledgement, any material previously submitted for a degree or diploma in any university. To the best of my knowledge and belief, it does not contain any material previously published, written or orally communicated by any other person or me, except where due reference is made in the text. I also hereby give consent for my dissertation, if accepted, to be made available for photocopying and for interlibrary loans, and for the title and summary to be made available to outside organizations”

University of Moratuwa.

## ABSTRACT

Software projects are the lifeline of software development organizations. Due to the ever increasing complexities in systems, it is paramount that extensive planning and risk assessment is performed to ensure successful project completion. As an emerging industry in Sri Lanka, sound software project risk management is of crucial importance. This study is focused on measuring the awareness of software project risk management in Sri Lankan software industry.

The study focuses primarily on investigating three key objectives: Firstly, identify the overall level of awareness of the software project risk management in Sri Lankan software industry. Secondly, extract the factors affecting to software project risk management and thirdly discussion on the risk response methods to the most significant risks found from survey results. Finally, the research discusses recommendations on improving the performance on better software project risk management based on the interviews conducted and the literature review.

The research uses both qualitative and quantitative approaches to fulfill research objectives. Data was primarily gathered through the questionnaire and interviews. The questionnaire was distributed among selected professionals in Sri Lankan software industry.

The results of the study indicate that the overall level of risk awareness in Sri Lankan software industry is above the average, evaluating to an estimated overall mean value of 3.7 out of 5. Study revealed that the awareness of software project risk management is dependent on the '*organizational characteristics*' such as *size*, *complexity* and *cost* of the project, *organizational culture* and *higher management initiative*. However there is no evidence to state that awareness is dependent on '*technological aspects*' and '*individual characteristics*'.

Since the '*organizational characteristics*' have a relationship with the risk awareness, it is advisable to strictly adhere to the processes and policies within an organization to ensure the positive outcome.

## ACKNOWLEDGEMENT

Firstly, I would like to extend sincere thanks to my supervisor, Prof. Niranjan Gunawardena, Deputy Vice-Chancellor University of Moratuwa, for accepting my proposal and always being receptive, supportive and flexible. His constant confidence in me was definitely a driving factor to make this endeavor a success.

I would like to thank specially, our head of department, Mrs. Vishaka Nanayakara. Your patience was invaluable when running out of time.

I owe my deepest gratitude to Mrs. Dilini Kulawansa, Head of Department of Information Technology, for unconditionally taking time to give advice and show that analysis, in itself, is an art.

I would also like to acknowledge the support and guidance provided by the academic and non academic staff of the Department of Computer Science and Engineering.

I am indebted to my colleagues, who supported me in number of ways while completing their own research.

I would also like to give special thanks to my parents and my brother for their inspiration and encouragement. Without their support this research would not have been possible.

And last but not least, I wish to thank Aruna, for had it not been for the constant support and encouragement from him, this would not have materialized.
