DECLARATION

I declare that this is my own work and this thesis does not incorporate without acknowledgement any material previously submitted for a Degree or Diploma in any other University or institute of higher learning and to the best of my knowledge and belief it does not contain any material previously published or written by another person except where the acknowledgement is made in the text.

Also, I hereby grant to University of Moratuwa the non-exclusive right to reproduce and distribute my thesis, in whole or in part in print, electronic or other medium. I retain the right to use this content in whole or part in future works (such as articles or books).

Signature:

Date: 19.06.2023

The above candidate has carried out research for the PhD thesis under my supervision.

Name of the supervisor: Dr (Mrs) A.T.P. Silva

ABSTRACT

Customer reviews play a vital role in e-commerce. Most online customers depend on online reviews before making a purchasing decision, and the credibility of online reviews significantly impacts the company's reputation. Given the significance of reviews in generating revenue, some business owners reward reviewers who are dishonest. Consumer reviews are continuously produced at a high volume, velocity, and degree of unstructured. Hence, they can be treated as big data and need big data analysis methods to detect deceptive reviews. Due to the challenges highlighted among different classification processes, there is a research challenge in designing an effective deceptive review detection mechanism without focusing on labelled datasets in real-time. This research combines review-centric and reviewer-centric features in the feature selection stage and finds the deceptive level of each review based on those features without focusing on classification. The purpose of this research is to use multi-agent technology, a modern trend in Artificial Intelligence, to support the deceptive review detection process to automate complex tasks such as real-time data acquisition, feature selection, and calculating deceptive levels by ensuring high accuracy. The system follows a module architecture where all modules are incorporated with agents performing module tasks by communicating, coordinating, and negotiating with each other. The fuzzy agents in the credibility analysis module incorporate review content honesty, content quality, reviewer expertise, and reviewer trustworthiness for analysing the review credibility and reviewer credibility. The deceptive levels were calculated based on the credibility values. The human evaluated results were used to compare the results of the proposed model, k-means cluster results, and outlier-based deceptive identification method. The evaluation results indicated that the accuracy of detecting deceptive consumer reviews using multi-agent technology in big data analytics is 81% where the cluster model showed 73% and outlier-based model showed 63%. Also, the evaluation showed the importance of considering both review credibility and reviewer credibility when deciding on deceptive level. Therefore, the challenges encountered in existing deceptive review detection methodologies, such as scarcity of labelled data for model training, real-time data analysis, and uncertainty of credibility, were resolved by incorporating multi-agent technology in big data analytics. The ultimate goal of noticing the misleading level of reviews is to create an assured customer who will boost the business's revenue by expanding purchases because of the trustful and reliable reviews.

Keywords : e-commerce, review honesty, content quality, reviewer trustworthiness, reviewer expertise, credibility, fuzzy inferencing

DEDICATION

I dedicate this thesis

to

my beloved

father

and

husband

ACKNOWLEDGMENT

Foremost, I wish to express my sincere gratitude to my two supervisors, Snr. Prof. A.S. Karunananda and Dr (Mrs) A.T.P. Silva, for their continuous support for my PhD research, and their patience, motivation, enthusiasm, and immense knowledge. I am grateful to Snr. Prof. A.S. Karunananda for enlightening me the first glance of research. Their guidance helped me throughout the research work and during thesis writing. They were the best advisors and mentors for my PhD study. I would like to thank the other members of my progress review evaluation panel, Dr (Mrs) D.D.M. Ranasinghe, Dr L. Ranathunga, Mrs D.T. Kulawansa, and Dr (Mrs) T. Piyatilake, for their encouragement, insightful comments, and challenging questions.

I sincerely thank the Vice Chancellor, General Sir John Kotelawala Defence University, Major General Milinda Peiris RWP RSP VSV USP ndc psc, former Dean, Faculty of Computing, Cmdr. JU Gunaseela USP, psc., present Dean, Faculty of Computing, Dr A.D.A.I. Gunasekara, former Head of Department, Department of Information Technology, Mr R.P.S. Kathriarachchi, for encouraging me, offering resources, and releasing me from hard work during this challenging period. Further, I wish to thank my fellow staff members Dr (Mrs) N. Wedasinghe and Major R.M.M. Pradeep, for their advice, encouragement, and support bestowed upon me during this period. My heartfelt gratitude also goes to all staff members of Faculty of Computing, General Sir John Kotelawala Defence University, for being with me and supporting me in numerous ways.

Also, I wish to thank Ms Darshanie Premathilake, freelance copy editor of EDIT&READ Copy Editing and Proofreading Services, for providing me with proofreading service on time. Last but not least, I thank my beloved father, Dr W. Vidanagama, my beloved husband, Mr S.M.A. Kulathunga, and all the family members for supporting me spiritually throughout my journey to academic achievement.
