## ACKNOWLEDGEMENT

I gratefully record my thankfulness to the officials of the Sri Lanka Ports Authority and the officials of the South Asia Gateway Terminals who have made valuable contributions to this study with suggestions and information. I am particularly grateful to my supervisor, Dr. Sanath Jayasena for his kindly guidance for the completion of the study undertaken by me.

I extend my gratitude to my wife Lavanya for her constant support and encouragement, and my daughter Narmada and son Lasith for bearing patiently my absence, working on this research.

I am especially thankful to my father-in-law, Mr. Jinasoma Weerasuriya for proof reading the whole document paying attention to spelling and grammatical mistakes within a very short time.

I also wish to record with gratitude my appreciation of the assistance I received in numerous ways from all my colleagues in the JCT office at SLPA.

## DECLARATION

I certify that this dissertation does not incorporate without acknowledgement any material previously submitted for a degree or diploma in any University and to the best of my knowledge and belief it does not contain any material previously published, written or orally communicated by another person or myself except where due reference is made in the text. I also hereby give consent for my dissertation, if accepted, to be made available for photocopying and for interlibrary loan, and for the title and summary to be made available to outside organizations.

## ABSTRACT

In the Port of Colombo 65% of the container business depends on transshipment. As such it is very important to understand the key factors that promote customer satisfaction and productivity, because unsatisfied customers may change their operational base for transshipment to other more attractive ports or terminals in the region following the recent developments in the ports in the Indian subcontinent.

The completion of operations for a container vessel within a planned period is one of the prime requirements that the customer expects from the terminal operators, which otherwise will cost them heavy expenditure. Two main reasons for the failure to achieve the above objective are the non-availability of container handling cranes, which may occur suddenly in the midst of operations, and low productivity resulting from various other causes such as breakdowns or faults, accidents, planning problems, weather conditions and so on. In this scenario, ICT systems used in container-handling equipment play a major role, since ICT systems installed in the crane will help to solve many of the problems mentioned above.

In this research the main objectives are to find out the relationship between the ICT level used in container handling cranes and the availability of such cranes and also how ICT systems are used to improve productivity of the quay cranes. The results of the research will help to take strategic decisions on the future procurement of cargo handling equipment. Further this will also give an indication for the replacement of old cranes with state of the art new equipment.

Most of the developed ports in the world use ICT systems in almost every segment in the cargo export and import processes and they continue to invest on further improvements. But we are still reluctant to use, and less prepared for it, although customers demand more from the seaports and the terminal operators. The results of the research show that the use of ICT systems has a big contribution to make towards the availability and productivity of quay cranes and hence customer satisfaction.
