Abstract

In Sri Lanka, at present farmers are not getting competitive prices for their agricultural products as they are being exploited at the hands of a hierarchy of middlemen. They are also not acquainted with the modern technology to get timely and accurate market information on agricultural commodities. Further an efficient mechanism does not exist for framers in remote areas and traders to negotiate on trading deals as well as for payment processing. This research focuses on implementing a cost effective solution based on SMS messages that enable farmers to gain a higher profit margin for their crops by directly liaising with the buyers for the sale of products at completive prices in agro trading.

This research proposes the development of SMS Based Trading Portal with the support of a web client that aims to assist some administrative operations and user queries.

The proposed system is based on a typical stock trading system where the farmer advertises his products and trader then directly negotiate with farmer through biding mechanism to achieve competitive advantage on either side. To facilitate the provision of an end to end comprehensive solution to addresses issues in agro trading, the system is also equipped with an efficient automated mechanism for payment processing and order transportation. Further more the system eventually interacts with stakeholders through automated alert service. It also exposes a web service as an integration point for third parties to interact with the system.

As per the test results system has demonstrated a good response time for all user queries maintaining a high accuracy in the responses when there was a reasonable data load. The automated farmer- trader offer matching and notification generation service proved to be well operating and the bidding process is well streamlined with the business requirement ultimately leading to automated fund transfer with high accuracy.

Acknowledgements

First, I would like to thank my supervisor Dr. Prasad Jayaweera whose excellent supervision and invaluable suggestions enabled me to complete this project successfully.

Closely behind is my co-supervisor Mr. Puvanendran Senthilruban who rendered an enormous support in providing technical supervision in implementing the concept of SMS based agro trading.

Dr. Sanath Jayasena, MSc Coordinator/Head of the Dept. of Computer Science & Engineering needs to be especially acknowledged for his support both at an administrative level and as a mentor.

I must be grateful to Dr. Gihan Dias for providing guidelines for finding a good research project as well as for especially directing me towards SMS based agro trading which generated the enthusiasm to engage with the current implementation.

I would like to thank Ms. Vishaka Nanayakkara for conducting the subject research seminar with as well as for the enthusiasm shown in finding the most suited supervisor for my project. Also my sincere thanks go to Prof. Dileeka Dias from the electronics department for her support in obtaining a GSM Modem for testing purposes.

Rohitha, my colleague in the same batch who introduced me to Mr. Dinesh Saparamadhu at hSenid is also acknowledged with gratitude. I must be grateful to Mr Dinesh for allocating Mr. Senthil as my co-supervisor as well.

My sincere thanks go to Thanya ,Nishan ,Padman,Sandhakal,Manjula and Misnad for supporting me in various ways and Vijitha for lending me his mobile phone for testing.

Finally I would like to thank my loving wife for bearing with me for the entire duration of this engagement with patience.
