

**INVESTIGATION OF PARAMETERS OF A  
STAND ALONE POWER GENERATING SYSTEM, USING  
AN INDUCTION MACHINE IN  
SINGLE- PHASE GENERATOR MODE**

By

N.G.D. Wijesiriwardene

This Thesis was submitted to the Department of Electrical Engineering of the University of Moratuwa in partial fulfillment of the requirements for the Degree of Master of Engineering in Electrical Engineering.

## **.Abstract**

*In Sri Lanka only around 35% of rural population has reached grid electricity. Therefore stand alone power generation systems will be a major option to provide electricity to rural population as we are rich with hydro resources.*

*In rural electrification, even though DC generators and synchronous generators are used, induction generator has become common in use due to more convenient features like ready availability, simplicity, reliability and robustness.*

*Now the single-phase power with a three- phase induction machine has become an economical options to generate power in stand- alone power generating systems. It is now widely used in Pico scale stand alone power generating systems in Sri Lanka.*

*When a three- phase induction motor is used as a generator in single- phase mode, it should be designed to operate near the best operating point, to provide maximum power output and minimum unbalance. Literatures on this area of subject and published test results are few; manufactures of motors rarely show an interest to measure and publish test results of their standard machines in generator mode [2].*

*In this situation it is difficult to find data in this type of generators installed in this country also. It was seen that to find and analyze data of stand alone power generating systems and to study about its parameters will be useful due to the poor availability of literature in this area.*

*Also according to the investigations made, many Pico scale hydro developers seems not paid due attention on whether their plants operate at optimum power out put at minimum unbalance.*

*This study was basically focused to investigate the parameters of a stand alone single phase power generating system using a three phase induction generator to find the system behavior, specially at minimum unbalance with a maximum power output. The study also includes the analysis of the system to find the behavior of the total( generating and distribution) system.*

## DECLARATION

I hereby declare that this submission is my own work and that, to the best of my knowledge and behalf, it contains no material previously published or written by another person nor material, which to substantial extent, has been accepted for the award of any other academic qualification of an university or institute of higher learning except where acknowledgment is made in the text.

## CONTENTS

ITEM	PAGE NO.
DECLARATION	I
ABSTRACT	II
CONTENTS	III
LIST OF TABLES	VII
LIST OF FIGURES	VIII
ACKNOLEDGEMENT	XI

### CHAPTER 1 RESEARCH PROBLEM BEING ANALYZED

1.1	Introduction	1
1.2	Overview of small scale power generation	2
1.2.1	Background of small-scale generation in Sri Lanka	2
1.2.1.1	Village hydro projects	2
1.2.1.2	Present & future planning, excursion for rural electrification in Pico scale micro hydro projects	3
1.2.2.1	Present status in Pico Hydro projects	3
1.2.2.2	Future planning & excursion	5
1.3	Research problem at the scene	7
1.4	Objective of the study	7

### CHAPTER 2 THEORETICAL ANALYSIS

2.1	Working principle of an induction machine	8
2.2	Induction machine in generator mode	10
2.2.1	Effect of saturation	10

2.2.2	The self excited generator	11
2.2.3	The problem of voltage & frequency control of induction in isolated generator operation	12
2.3	Torque speed characteristics	15
2.4	The circle diagram	16
2.5	Induction generators in conjunction with a load controller	19
2.5.1	Conjunction with a Load Controller	20
2.5.2	Reactive power control	20
2.6	Single – Phase output from a Three -Phase Machine	23
2.6.1	Balancing the single – phase load over the three phases of the Induction generators in the C-2C connection	24

### CHAPTER 3 LITERATURE SURVEY

3.1	Induction generator controllers	27
3.1.1	Fixed and variable load system.	27
3.1.2	Variable load systems	28
3.2	Controller Options	30
3.2.1	Phase angle control	30
3.2.2	Binary weighted loads	31
3.2.3	Mark- Space ratio controller	32
3.3	Comparison over synchronous generator	35
3.3.1	Options of voltage frequency variables.	35
3.3.2	Advantage of the induction motor an generator	36
3.3.3	Disadvantages of the induction motor an generator.	37

### CHAPTER 4 METHODOLOGY

4.1	Methodology	38
4.2	Tests carried out	45
4.3	Analyzing the system using software	45

## CHAPTER 5 OBSERVATION / RESULTS / DATA

5.1	Determination of excitation capacitance in conventional way	46
5.1.1	Electrical test Method	46
5.1.2	Induction motor performance data.	47
5.1.3	Excitation capacitance for Induction Generator when the maximum output at minimum unbalance.	47
5.2	Determination of correct capacitor connection ( Power output test)	47
5.3	Winding current test	49
5.4	Generator performances	49
5.4.1	Performances at calculated capacitance value	49
5.5	Performances of the generator with different excitations	51
5.6	Generator performances at minimum unbalance and maximum power output at optimum excitation	53
5.6.1	Current variation in the system.	54
5.6.2	Voltage variation in the system	55
5.6.3	Harmonics in the system	56
5.7	Generator performances with continuous operation	57
5.7.1	Thermal response	58
5.7.2	Power variation in the system	58
5.7.3	Temperature and frequency variation	59
5.8	Generator system parameters at maximum power at minimum unbalance with different excitation	59
5.8.1	Voltage variation in the system	60
5.8.2	Load variation in the system	61
5.8.3	Current variation in the system	61
5.9	generator performance with induction generator controller	62
5.9.1	Generator performance when resistive load in the system	62
5.9.1.1	Harmonics variation in the system	63

5.9.1.2	Output voltage variation in the system	63
5.9.2	Generator performance with IGC for reactive power loads	64
5.9.2.1	Speed variation in the system	64
5.9.2.2	Power Factor variation in the system	65
5.10	Other analysis of the system	72
5.10.1	Finding parameters using flow charts	75
5.10.2	Finding generator parameters using software	81
CHAPTER 6	SYSTEM ANALYSING/ DISCUSSION	84
CHAPTER 7	CONCLUSION	88
REFERENCES		90
ABBREVIATIONS		92
APPENDIX		
Appendix 1	Generator system data	93
Appendix 2	Visual Basic programme code	99

## LIST OF TABLES

### CHAPTER 1

- 1.1 Distribution of all sites by the status of sites and capacity
- 1.2 Completed Pico scale hydro projects in Sri Lanka by status of districts
- 1.3 Generating capacities of completed projects
- 1.4 Pico scale hydro projects in Sri Lanka projects in progress
- 1.5 Generating capacities – projects in progress

### CHAPTER 5

- 5.1 Determination of correct capacitor connection in the system
- 5.2 Generator performance at conventionally calculated capacitance value
- 5.3 – 5.7 Induction generator performances at different excitation
- 5.8 Generator performances at minimum unbalance and maximum power output at optimum excitation
- 5.9 Generator performances in continuous operation.
- 5.10 Characteristics of the generator at Balance Operation with different excitation
- 5.11 Induction generator parameters with IGC for Resistive Loads
- 5.12 Induction generator parameters with IGC for Reactive Loads
- 5.13 Recommended motor voltage ratings
- 5.14 K values

### CHAPTER 6

- 6.1 Details from the presently running generators

### APPENDIX

- A-1 Motor performance data
- A-2 Current – carrying capacity
- A-3 Voltage Drop

## LIST OF FIGURES

### CHAPTER 1

- 1.1 Completed Pico scale hydro projects in Sri Lanka
- 1.2 Pico scale hydro projects in Sri Lanka in progress
- 1.3 Cumulative growth in Pico scale hydro projects in Sri Lanka

### CHAPTER 2

- 2.1 Power flow of a three phase induction motor
- 2.2 Power flow of an induction machine in generator operation
- 2.3 Typical magnetization curve of a common core material and  
Increase of reactive current in generator operation
- 2.4 Self excitation of an induction machine by a  
capacitor in parallel at no load
- 2.5 Development of voltage at increasing load and demagnetization limit-  
loading at constant frequency
- 2.6 Development of voltage at increasing load and demagnetization limit-  
loading at decreasing frequency
- 2.7 Typical torque speed characteristics of a squirrel cage induction machine
- 2.8 The circle diagram
- 2.9 Frequency variation of an IGC controlled induction generator when loaded  
with an induction load
- 2.10 Single -Phase output from a three phase machine
- 2.11 C-2C connection for a three- phase Induction Generator with a single phase  
resistive load
- 2.12 Voltage and current phasor diagrams for a  $\cos \Phi_g = 0.5$

### CHAPTER 3

- 3.1 Basic Principal of electronic load controller

- 3.2 Ballast currents waveform for a phase angle control
- 3.3 Binary – weighted load controller and ballast current range
- 3.4 Basic switching circuit – single phase mark-space ratio controller
- 3.5 Typical ballast voltage waveform
- 3.6 Three phase mark-space ratio controller

#### CHAPTER 4

- 4.1 Model used
- 4.2 Single phase output from a three phase machine
- 4.3 Induction Generator System
- 4.4 Generator driving system
- 4.5 IGC panel
- 4.6 Instruments used
- 4.7 Induction generator controller - block diagram

#### CHAPTER 5

University of Moratuwa, Sri Lanka.  
Electronic Theses & Dissertations  
[www.lib.mrt.ac.lk](http://www.lib.mrt.ac.lk)

- 5.1 Current variation in the system with power consumption
- 5.2 Voltage variation in the system
- 5.3 Harmonics in the system
- 5.4 Thermal response
- 5.5 Power variation with continuous operation
- 5.6 Temperature & frequency variation with continuously operation
- 5.7 Voltage variation with different excitation
- 5.8 Load variation in the system with different excitation
- 5.9 Current variation in the system with different excitation
- 5.10 Harmonic variation when resistive load is present
- 5.11 Out put voltage variation with IGC
- 5.12 Speed variation in the system
- 5.13 Power factor variation in the system

- 5.14 Frequency variation with reactive loads in the system
- 5.15 Three phase currents –Balanced condition
- 5.16 Three phase currents –Unbalanced condition
- 5.17 Generator output wave form – Voltage
- 5.18 Voltage waveform-dummy Load
- 5.19 Generator output wave forms – Voltage & Current  
Output waveforms comparison
- 5.20 Power distribution
- 21-5.25 Flow chats – finding generator parameters
- 5.26 a-e Finding generator parameters using software

## CHAPTER 6

- 6.1 Generator capacities

## APPENDIX

- A-1 Connection of generator & controller
- A-2 Generator performances
- A-3 Typical characteristics of an induction motor
- A-4 Performance curves of an induction motor for motoring and generating

## ACKNOWLEDGEMENT

First of all I would like to express my sincere thanks to my project supervisor, Dr. J.P.Karunadasa, senior lecturer, University of Moratuwa, who gave me a valuable guidance and very kind hearted co-operation for me in carrying out of this project. Also to Dr. Jehan Peiris, Dr. Priyantha Wijetunge, Dr. Nalin Wickramarachchi and to Professor J.R.Lucas of University of Moratuwa , for the encouragement extended throughout this study.

My very special thank goes to Dr. Nishantha Nanayakkara who gave me valuable ideas to carry out this project.

I would also like to acknowledge the staff at The National Engineering research and Development Centre of Sri Lanka for providing facilities to carry out the project. My special thanks goes to the General Manager of NERD Centre, Mr. M.W. Leelaratne for his encouraging thoughts during carrying out this project.

I express my thanks to Electrical and Electronic Engineering department of NERD Centre, and specially to Mr. M.A. S. Bandara who supported me in laboratory testing through out the project. Also very specially to Mr. Sivathas, electrical engineer who gave me corporation in various ways.

I express my thanks to Intermediate Technology Development Group, who supported me to collect data in this area and specially to Mr. Neville Jayalath and to Mr. Rohan Senerath. And very special thanks to Dr .Nigel Smith of Nottingham University, U.K. Thanks also goes to Mr. P.C. Hettiarachchi , of 'System Engineering', providing information in this area.

Finally, I would express my sincere gratitude , who helped me in numerous ways in different stages to make this project a success.

N.G.D. Wijesiriwardene
