Thesis submitted in partial fulfillment of the requirements for the degree Master
of Science of Engineering

Department of Electrical Engineering

University of Moratuwa
Sri Lanka

July 2012

DECLARATION

I declare that this is my own work and this thesis does not incorporate without acknowledgement any material previously submitted for a Degree or Diploma in any other University or institute of higher learning and to the best of my knowledge and belief it does not contain any material previously published or written by another person except where the acknowledgement is made in the text.

Also, I hereby grant to University of Moratuwa the non-exclusive right to reproduce and distribute my thesis, in whole or in part in print, electronic or other medium. I retain the right to use this content in whole or part in future works.

ACKNOWLEDGEMENT

I specially thank my supervisors, Prof. S. P. Kumarawadu and Dr. D. P. Chandima for their unwavering guidance, support and advice for carrying out this research work successfully.

I would like to take this opportunity to extend my thanks to Dr. Rohan Munasinghe, Dr. Harsha Abeykoon for being the members of the progress review committee for my research. Without their guidance and advice this work wouldn't have been a success at the end.

I am also grateful to the engineering and technical staff at CEB meter testing lab in Piliyandala for arranging equipments to calibrate my digital meter. I would sincerely express my gratitude to management of Dankotuwa porcelain industry for the permission granted to take electrical demand readings at the preliminary energy audit. I should also thank to Mr. Wickrama Kanattawatta who helped me on proof reading.

Finally, my thanks go to various other personnel without whose help this work wouldn't be a success.

ABSTRACT

This research study focuses on demand management and energy conservation through smart metering. The discussion here is based study on smart metering and implementation of new methodologies to promote energy conservation via two way interaction. Smart metering, a key element of the so-called smart grid, has been touted as a great bright hope that will enable residential and industrial electric customers to cut their usage, thereby reducing greenhouse gases as well as their monthly bills. Smart meters are still evolving and many developers try to add new features to provide more interaction between the consumer and the supply authority.

Improved measurement technology by displaying all per phase information and three phase information on LCD at the meter side, automatic meter reading, power quality and exported energy measuring capability are the main features of the implementation. Electricity demand forecasting for 15 minutes, maximum demand warning for industrial consumers, energy and cost forecasting for better energy conservation are the originality of this research.

The digital meter was developed using ADE7758 energy measuring chip and 18F452 PIC microcontroller. The data are sent to a remote server via SMS using SIM900 GSM module. PCF 8583 real time clock IC was used to read the time and generate alarm signals. The phase information, frequency, active energy, exported energy, power quality measurements, electrical demand, date and time are sent to the server. The server handles the incoming SMS, processes the data, displays and stores the required information. Energy consumption and its cost, average daily energy consumption and cost prediction for the month are calculated in the server side.

The demand forecasting algorithm is developed for industrial smart metering applications. Electricity demand within 15 minutes is forecasted by analyzing demand pattern. The warning signal is generated when the demand is higher than the user specified value. Therefore if there is a sudden increase in demand this methodology helps to identify and warn the consumer via SMS. The expected demand within 15 minutes, percentage value of the expected demand as a ratio to user specified demand and remaining time to reach the demand are calculated and sent to the consumer to take any actions to drop down the demand. This warning signal will be beneficial to the industrial consumers who are interested in save on maximum demand charge through proper load management.

Keywords: smart metering, demand management, energy conservation, three phases, automatic meter reading, remote server, electricity and cost forecasting, demand forecasting, maximum demand warning, Industrial consumers

TABLE OF CONTENTS

Declaration of the Candidate & Supervisor	i
Dedication	ii
