ABSTRACT

The development of the industrial age has seen a remarkable growth which has led to competition not of products but of the supply chains. A related problem such organisations face is the difficulty in identifying the most appropriate way of managing the operation in a cost effective and efficient for the organisation as a whole. The better way to solve such kinds of problems, is the use of Operations Research (OR) techniques. The purpose of this project is to use statistical techniques to solve operational problems and further optimise the model. Here an operational environment is used to apply this learning with the intension of gaining benefits in terms of cost savings and service improvement.

Here two operating models (model A and model B) were studied in detail study, its pros and cons as well as problems that may arise were identified. Since the model needed to be cost effective, the main cost elements were identified and their impacts were quantified base on the past information and finally forecast figures were estimated. Based on all the key parameters, the final impacts of the models were derived along with the optimum inventory model and the feasibility of the model is also evaluated.

Finally, the outcomes were evaluated for all the cost elements using the actual data of the two models and the best model has been concluded to be Model B since it is cost effective by 6.5% and also service oriented. At this point, deviations of cost due to inefficiencies in the operation were also identified where the main cause is due to poor inventory management. Therefore, could conclude that proper inventory management is essential in order to optimise model B and for it to be feasible.

The inefficiencies were proposed to be solved as future projects. The difficulties faced during the study and limitations are also been discussed.

Finally, recommendations are provided such as identifying a better location to relocate the Regional DC (Distribution Centre) and to develop an optimum distribution network to reduce the distribution cost.

*To My Parents
With Love*

ACKNOWLEDGEMENTS

There are a number of persons who helped and guided me in various ways to accomplish the successful completion of this project with a deep sense of gratitude. I, hereby wish to acknowledge their invaluable contribution.

First and foremost, I would like to thank God for the blessings he has granted upon me, and for giving me the wisdom, knowledge and most importantly the courage to overcome all the obstacles I faced in completing the project.

I acknowledge with deep gratitude for the valuable guidance, valuable suggestions and encouragement rendered by Mr. T. M. J. A. Cooray, Department of Mathematics, Faculty of Engineering, University of Moratuwa to complete this project successfully.

I express my sincere thanks to Mr. Binupa Liyanage (Director – Hayleys Advantis), Mr. Chintaka De Zoysa (General Manager– Hayleys Advantis) and Lasitha Senanayake (General Manager – Logiwiz Limited) for providing the opportunity to carry out this project. The support rendered by the client operations team headed by Mr. Chandima Perera (Executive), Kashun Abeyssekara (Supervisor) and all the workers at the site for the corporation extended to me in obtaining data & their useful inputs.

To my parents & husband, I wish to express my appreciation and gratitude for providing the much needed love and encouragement specialty at times when things were not going as well as I expected. I thank them for providing all the resources that were necessary.
