## DECLARATION

I declare that this is my own work and this thesis/dissertation does not incorporate without acknowledgement any material previously submitted for a degree or diploma in any other university or institute of higher learning and to the best of my knowledge and belief it does not contain any material previously published or written by another person except where the acknowledgement is made in the text. I retain the right to use this content in whole or part in future works (such as articles or books).

Signature:

Date: 27/09/2025

The above candidate has carried out research for the PhD/MPhil/Masters thesis/dissertation under my supervision. I confirm that the declaration made above by the student is true and correct.

Name of Supervisor: Dr P.L.N. Fernando

Signature of the Supervisor:

Date: 06.02.2026

## ACKNOWLEDGEMENT

I wish to extend my sincere gratitude to the Faculty of Graduate Studies, University of Moratuwa, for offering the Master of Science (Major Component of Research) programme, which has provided me with the opportunity to pursue this research degree.

My sincere thanks go to the Department of Civil Engineering, University of Moratuwa, for providing a stimulating and resourceful environment that greatly facilitated the successful completion of this research. I also wish to express my heartfelt gratitude to Prof. U.P. Nawagamuwa, Head of the Department, and Prof. H.R. Pasindu, Department Research Coordinator, for their guidance and encouragement in achieving this milestone.

I am especially indebted to my supervisor, Dr. Lakshitha Fernando, whose expertise, constructive feedback, and patient guidance were invaluable in shaping the direction and quality of this research. I also extend my appreciation to Dr. Damith Mohotti, Dr. Kasun Wijesooriya, and Mr. Pasindu Meddage of the University of New South Wales, Canberra, for their valuable support and insights throughout this research journey.

Finally, I am thankful to all who assisted me in various ways during the completion of this project. This thesis stands not only as a reflection of my efforts but also as a testament to the collective support and encouragement I have received.

N.T. Vandabona,  
Department of Civil Engineering,  
University of Moratuwa.

## ABSTRACT

Understanding and predicting shock wave propagation in functionally graded multi-material systems is critical for advancing impact-resistant materials. As such, impedance-graded multi-metallic (IGMM) systems, where the materials are arranged in their reducing order of impedance, have shown to offer superior performance over monolithic materials by effectively mitigating the effects of shock wave transmission. Due to complex relationships among variables that influence performance of IGMM systems (e.g. individual metal layer thicknesses, total thickness, and impact velocity or stress), using numerical modelling techniques to study each parameter can be time-consuming. In contrast, machine learning (ML) models, once trained, have the potential to provide quick responses with minimal user input. Therefore, this study introduces an ML-based approach to predict stress-time history, velocity-time history, and maximum tensile stress at the final layer in IGMM systems consisting of steel, titanium, and aluminium, subjected to high-velocity impacts generating shock waves in materials. A total of 370 impact events were simulated using LS-DYNA, changing the input variables, to generate datasets for training and testing three tree-based ML models; Decision Tree, Random Forest, and Extreme Gradient Boost (XGB). Experimental results from a previously conducted single-stage gas gun test were used in the numerical model validation. XGB outperformed other models, achieving testing coefficient of determination ( $R^2$ ) values of 0.98 and 0.99 for stress and velocity-time history predictions, and 0.92 for maximum tensile stress predictions. Shapley Additive Explanations (SHAP), which is an explainable machine learning technique, were used to interpret how material and system parameters influence predictions, ensuring alignment with fundamental shock wave physics. Finally, an inverse prediction framework was developed to identify optimal thickness combinations of steel, titanium, and aluminium that meet predefined mechanical performance criteria. This study acts as an interpretable, data-driven alternative to numerical modelling which offers a feasible approach to optimising IGMM systems under shock wave propagation.

| Table 3.3: Overview of LS-DYNA models utilised for dataset generation.....                                                                        | 25 |
| Table 3.4: Model combinations with varying target thickness and initial stress for impact analysis.....                                           | 26 |
| Table 3.5: Data description for training ML models .....                                                                                          | 27 |
| Table 3.6: Descriptive statistics of the independent and dependent variables .....                                                                | 28 |
| Table 4.1: Hyperparameter configurations tested during optimisation and corresponding optimal results from random search method.....              | 37 |
| Table 4.2: Estimated computational requirements for simulation and model training .....                                                           | 38 |
| Table 4.3: Performance indices for optimised tree-based models .....                                                                              | 42 |
| Table 4.4: Effect of target features on the reduction of stress-time history, velocity-time history, and maximum tensile stress predictions ..... | 48 |
| Table 4.5: Numerical model results for configurations with 30 mm total thickness at 12 GPa initial stress level.....                              | 49 |
| Table 4.6: Optimal thickness configurations satisfying both Y-Stress and Y-Velocity criteria .....                                                | 51 |
| Table A.1: IGMM target combinations used in the study.....                                                                                        | 62 |
| Table B.1: IGMM system combinations with total thickness of 30 mm under 12 GPa impact stress.....                                                 | 65 |
| Table B.2: IGMM system combinations of varying thicknesses subjected to all initial stress levels .....                                           | 66 |
| Table D.1: Selected impact events for comparative evaluation of numerical and ML-predicted responses .....                                        | 68 |

## LIST OF ABBREVIATIONS

|       |                                                |
|-------|------------------------------------------------|
| ANN   | Artificial Neural Network                      |
| BPNN  | Back-Propagation Neural Network                |
| $C_0$ | Bulk Sound Velocity                            |
| DT    | Decision Tree                                  |
| $e$   | Internal Energy                                |
| FEM   | Finite Element Method                          |
| FGM   | Functionally Graded Materials                  |
| GBM   | Gradient Boosting Machine Learning             |
| $g_x$ | Expected Value for SHAP Function               |
| $h$   | Explanation Model                              |
| HEL   | Hugoniot Elastic Limit                         |
| IGMM  | Impedance-Graded Multi-Metallic                |
| $K$   | Input Feature Subset                           |
| KNN   | K-Nearest Neighbors                            |
| LIME  | Local Interpretable Model-agnostic Explanation |
| $M$   | Complete Input Set                             |
| MAE   | Mean Absolute Error                            |
| ML    | Machine Learning                               |
| $N$   | Maximum Coalition Size                         |
| nMAE  | Normalised Mean Absolute Error                 |
| nRMSE | Normalised Root Mean Squared Error             |
| $P$   | Pressure                                       |
| R     | Pearson Correlation Coefficient                |
| $R^2$ | Coefficient of Determination                   |
| RC    | Reinforced Concrete                            |
| RF    | Random Forest                                  |
| RMSE  | Root Mean Squared Error                        |
| $s$   | Dimensionless Parameter in Hugoniot            |
| SSE   | Sum of Squared Errors                          |
| SHAP  | Shapley Additive Explanations                  |

|             |                                        |
|-------------|----------------------------------------|
| SVC         | Support Vector Classifier              |
| SVR         | Support Vector Regression              |
| $U_s$       | Shock Velocity                         |
| $u_{HEL}$   | Particle Velocity at HEL               |
| $u_p$       | Particle Velocity                      |
| $\nu$       | Poisson's Ratio                        |
| VEcv        | Variance Explained by Cross-Validation |
| VI          | Variable Importance                    |
| XGB         | Extreme Gradient Boost                 |
| XML         | Explainable Machine Learning           |
| $Y_d$       | Dynamic Yield Stress                   |
| $Z$         | Impedance                              |
| $\dot{z}$   | Fundamental Features                   |
| $\rho$      | Density                                |
| $\emptyset$ | Feature Attribution                    |

## LIST OF APPENDICES

|                                                                                                 |    |
|-------------------------------------------------------------------------------------------------|----|
| Appendix A: Impedance-Graded Multi-Metallic (IGMM) Target Combinations .....                    | 62 |
| Appendix B: Numerical Simulation Results of Responses under Varying Impact Conditions .....     | 64 |
| Appendix C: Pairwise Scatter Plot Matrix of Input and Output Features .....                     | 67 |
| Appendix D: Comparison of Numerical Simulation Results and Predicted Results of Responses ..... | 68 |
