ENERGY SAVING POTENTIALS OF WATER SUPPLY SCHEMES IN SRI LANKA

Gamage Don Harish Kosala

(178249A)

Thesis submitted in partial fulfilment of the requirements for the degree of Master of
Engineering in Energy Technology

Department of Mechanical Engineering

University of Moratuwa

Sri Lanka

September 2023

DECLARATION

I declare that this is my own work, and this thesis/dissertation does not incorporate without acknowledgement any material previously submitted for a degree or diploma in any other University or institute of higher learning and to the best of my knowledge and belief it does not contain any material previously published or written by another person except where the acknowledgement is made in the text.

Also, I hereby grant to University of Moratuwa the non-exclusive right to reproduce and distribute my thesis/dissertation, in whole or in part in print, electronic or other medium. I retain the right to use this content in whole or part in future works (such as articles or books).

ABSTRACT

The water supply industry and the energy sector are closely connected, with substantial energy requirements throughout the water supply process. This relationship is vital as climate change and global water and energy demands emphasize the urgency of enhancing energy efficiency in water supply sectors worldwide. Recognizing this, the National Water Supply and Drainage Board in Sri Lanka, responsible for water supply, acknowledges the need for strategic initiatives to optimize energy efficiency.

This study aimed to identify factors influencing Specific Energy Consumption (SEC) variations and developed a novel tool for investigating energy conservation potentials within Water Supply Schemes (WSS) in Sri Lanka. Studies indicate that approximately 96% of energy consumed in surface water treatment and distribution is attributed to water pumping. Optimum SEC Model introduced in this study utilizes specific speed to identify pump operating characteristics, estimate equipment inefficiencies, and establish economical norms for hydraulic gradient in pumping systems. In contrast to the current energy management concepts used in Benchmarking SEC, this approach replaces traditional energy audits targeting equipment inefficiencies and promotes the use of historical and operational data. Also, this technique opens the opportunity to compare location-specific SEC elements like topology and connection density.

Data gathered from the Matara Integrated WSS, operated by the National Water Supply and Drainage Board in Sri Lanka, was evaluated using the Optimum SEC model, revealing a 45% energy-saving potential compared to the actual electricity demand of 1716 kW. Furthermore, to corroborate these findings, a case study was conducted utilizing the WaterGEM model.

DEDICATION

I dedicate this study to my beloved parents, who have provided me with the strength and courage to overcome life's challenges. I am truly grateful for their inspiration, sacrifice, and unwavering moral support, which have played a significant role in shaping me into the successful individual I am today.

GDH Kosala

ACKNOWLEDGEMENTS

I extend my sincere gratitude to Dr. R A C P Ranasinghe, my advisor, and Dr. Indrajith D Nissanka for their continuous motivation, valuable advice, and kind support throughout my study. Their mentorship has been instrumental in the successful completion of this work, and I am deeply grateful for their contributions.

I am also appreciative to the academic and non-academic staff members of the University of Moratuwa for their steadfast assistance and dedication. Their collective support has created an enriching environment conducive to both learning and personal development. It is through their collaborative efforts that I have been able to grow academically and personally, and I am truly appreciative of their contributions to my journey.

I am indebted to Eng. B.G.A. Dinesh, my former supervisor, for his invaluable suggestions and guidance, which significantly contributed to refining this study. Also, special thanks to Eng. Lakshman Bogahapitiya, who shared his valuable experiences with me as a Technical Specialist during the "Energy Efficiency Emphasis at NWSDB" project conducted by The Alliance to Save Energy under USAID in 2006. The project proposals, "Five Year (2007-2011) Energy Efficiency Roadmap for National Water Supply & Drainage Board (NWSDB)," served as the foundation for establishing the energy-saving unit of National Water Supply and Drainage Board.

I am grateful for the cooperation of the Electromechanical Staff of National Water Supply and Drainage Board, Matara, whose support facilitated the regional energy data collection process. Their efficient management of regular tasks allowed me the necessary time to focus on my studies.

Lastly, I would like to express my love, gratitude, and appreciation to my family members, batchmates, and friends, especially Eng. Geethal Siriwardhana and Eng. Chithral Wajirapriya Abeykoon, whose unwavering encouragement and support were indispensable in the successful completion of my postgraduate studies.

LIST OF ABBREVIATIONS

Symbols

C	roughness coefficient
f_D	Darcy-Weisbach friction factor
g	Gravitational acceleration
H,h	Total head (m)
n	rotational speed (rpm)
Q	Flow rate
L	Pipe length of the pumping system
P	Power consumption of a pumping system
E	Pump Efficiency
E_m	Motor Efficiency
h_s	Static head of the pumping system
h_f	Friction head of the pumping system
R	hydraulic radius (A/P Cross Sectional Area of flow/Wetted Perimeter)
S	Hydraulic Gradient (h_f/L)
N_s	Specific Speed
N_{ss}	Suction Specific Speed
V	Velocity
γ	unit weight of water ($\gamma = \rho g$)
ρ	density of the liquid
$\cos \phi$	Power factor
$\eta_{M\&E}$	Mechanical & Electrical Efficiency

η_{hy}	Hydraulic/ Transmission Efficiency
η_{sys}	System Efficiency
ΔP	Pressure drop (head loss) in the pipe
