DECLARATION

I declare that this is my own work and this thesis/dissertation does not incorporate without acknowledgement any material previously submitted for a degree or diploma in any other University or Institute of higher learning and to the best of my knowledge and belief it does not contain any material previously published or written by another person except where the acknowledgement is made in the text. I retain the right to use this content in whole or part in future works (such as articles or books).

DEDICATION

Write your dedication here (if any)

ACKNOWLEDGEMENT

The success, capability and strength of my career development would not have been possible without the kind support and help of many individuals and organizations. I take this opportunity to grant the gratitude to the persons and organizations who have extended their cooperation to achieve success in my career. First of all, I am grateful to the Faculty of engineering, University of Ruhuna for paving the way to enter the profession of Engineering.

I am very much grateful to all professors, senior lectures, lectures and all other supporting staff members and my dear friends for paying their time and support on me for the successful outcome of this thesis, especially for Prof. Jagath Manathunge for his great support on me for helping and guiding me throughout this research.

It is my obligation to thank Mr. K. A. K. G. Kuruppu who give his great support as my supervisor as in my working place NWS&DB. I would like to thank, all the members of Kolonna Balangoda Water Supply Project of NWSDB and Planning and Design Section of Head Office, National Water Supply & Drainage Board for granting me the opportunities to gain the work experience in the field of Mechanical Engineering.

Secondly, I offer my sincere thanks to Eng. T. H. V. I Fernando Assistant General Manager of Donnor Coordination Unit of NWS&DB, K.G.N Saman Kumara Assistant General Manager of P&D division of NWS&DB who, guided and directed me to improve my career as my immediate supervisor. Their guidance helped me to build up the Engineering skills, team Working, and decision-making ability during the carrier. Also the support I received from all Engineers, with whom I work, is very much appreciated at this moment. Finally, I acknowledge the support received from numerous others not mentioned above who contributed to obtain the valuable achievements in my career.

ABSTRACT

Water transmission systems play a crucial role in ensuring efficient water distribution and management, with pumping systems constituting a significant portion of operational and maintenance costs. Efficient design and optimization of water transmission systems are paramount for sustainable water supply management. This abstract explores the complexities and challenges involved in the design phase of water treatment projects, emphasizing the importance of selecting an appropriate design horizon to align with project implementation stages.

This study presents a methodological approach for optimizing water transmission networks through cost-benefit analysis, aimed at reducing capital and operational expenses while enhancing system performance and it involves considering various parameters such as intake point locations, elevation differences, flow rates, transmission line lengths, and pump efficiencies. Specific speed calculations of pumps play a crucial role in determining system performance, with Variable Frequency Drive (VFD) utilization significantly impacting raw water transmission lines, particularly in regions with elevation discrepancies and seasonal variations in water extraction sources. According to the results output of the research VFD utilization must be carefully evaluated to ensure sustainable water supply management because according to the created model for treated water distribution line using VFD's are not cost effective.

The model aims to select the most suitable system configuration by considering capital cost savings, energy optimization, and financial viability. Inputs such as capital cost estimates, operational parameters, and financial considerations are utilized to assess different scenarios and identify the optimum values of system components.

In conclusion, optimizing transmission systems requires a comprehensive understanding of the interplay between various parameters and careful consideration of project implementation stages. By addressing these complexities, water treatment projects can achieve optimal performance, minimize costs, and ensure long-term sustainability in water supply management.

Keywords: *optimization, cost-benefit analysis, water transmission network, pumping system, Variable Frequency Drives (VFDs), sustainability.*
