DECLARATION

I declare that this is my own work and this dissertation does not incorporate without acknowledgement any material previously submitted for a Degree or Diploma in any other University or institute of higher learning and to the best of my knowledge and belief it does not contain any material previously published or written by another person except where the acknowledgement is made in the text.

Also, I hereby grant to University of Moratuwa the non-exclusive right to reproduce and distribute my dissertation, in whole or in part in print, electronic or other medium. I retain the right to use this content in whole or part in future works (such as articles or books).

Signature:

Date: 29th July 2024

The above candidate has carried out research for the Masters dissertation under my supervision. I confirm that the declaration made above by the student is true and correct.

Name of the supervisor: Dr. Kutila Gunasekara

Signature of the supervisor:

Date: 29th July 2024

ACKNOWLEDGEMENT

I would like to express my deepest gratitude to my supervisor, Dr. Kutila Gunasekera, for their invaluable guidance, support, and encouragement throughout the development of this thesis. Their expertise and insights have been instrumental in shaping this work.

I extend my heartfelt thanks to my family for their unwavering love, encouragement, and support. Their belief in me has been a constant source of motivation.

I am grateful to my friends and colleagues for their understanding and encouragement during this challenging yet rewarding journey.

ABSTRACT

Smartphones play a pivotal role in daily life, prompting researchers to increasingly emphasize peer-to-peer networks for connecting multiple mobile devices. This focus arises from scenarios where cellular coverage is unavailable, such as during disasters or conflicts when cellular tower communications are compromised. Researchers are currently exploring methods for individuals to connect with nearby users to establish social connections in such challenging circumstances.

This research presents the implementation of a middleware framework for infrastructure-less communication, comprising the Meshify API and the Meshify Core. The Meshify API provides interfaces for integrating the framework into applications, offering methods for device connectivity. The Meshify Core implements the necessary logic to manage the framework's functionality through the Meshify API. The middleware implementation is versatile and can be applied to various use cases involving wireless communication. Its layered architecture and modular design enable developers to extend their capabilities with minimal effort, ensuring adaptability to evolving wireless standards and protocols.

As part of this research, a Bluetooth multi-chat Android application was developed as a prototype to evaluate how the middleware facilitates communication over wireless networks.

Keywords - *Flooding, piconet, scatternet Bluetooth Classic, Wireless Technologies*
