ACKNOWLEDGEMENT

The Successful completion of this research completion of this research would not have been possible without the support, encouragement and cooperation of many individuals. I take this opportunity to extend my sincere appreciation to all those who contributed many individuals. I take this opportunity to extend my sincere appreciation to all those who contributed in various ways to make this study a reality.

My deepest gratitude goes to my supervisor, Dr. Kapila Devapriya, whose expert guidance constructive feedback, and continuous motivation greatly influenced the direction and quality of this research. His dedication and inspiring approach have been invaluable throughout the entire process.

I am also sincerely thankful to the academic staff of the Department of Building Economics, University of Moratuwa, for their guidance, advice and support during this research and throughout my academic journey.

Special thanks are extended to Mr. Srimal Fernando, Chartered Engineer and Senior General Manager of ACCESS Engineering PLC, for his professional insights, encouragement and assistance, particularly in facilitating the project case studies that enriched this study.

I am grateful to my colleagues, seniors and juniors for their cooperation, support and encouragement.

Above all, I owe my heartfelt thanks to my parents and family members for their unwavering support, patience, and spiritual strength, which gave me the confidence and determination to successfully complete this research.

DECLARATION

I hereby declare that this submission is my own work and, to the best of my knowledge and belief, it does not contain any material previously published or written by another person, nor material which has been accepted for the award of any other Master's degree or postgraduate qualification at any university or other institution of higher learning, except where due reference is made in the text.

I also grant the University of Moratuwa the non-exclusive right to reproduce and distribute my dissertation, in whole or in part, in print, electronic, or any other medium. I retain the right to use this work, in whole or in part, for future research publications such as journal articles or conference papers.

ABSTRACT

The Construction industry is a key driver of national economic development. In Sri Lanka, the expansion of large-scale infrastructure projects many funded by foreign investors has intensified industry completion and increased the involvement of international contractors. Although these development contribute significantly to economic growth, they also create complex contractual environments with multiple stakeholders, often leading to disputes related to quality, time and cost.

Civil Engineering projects are inherently complex due to their scale, technical requirements and the diversity of parties involved. When claims arise and remain unresolved, they frequently escalate into formal disputes and legal proceedings. Traditional litigation is often time consuming, costly and adversarial, potentially damaging professional relationship and delaying project completion. Therefore, the effectiveness of dispute resolution mechanisms plays a critical role in determining the success or failure of construction projects.

Alternative Dispute Resolution (ADR) methods such as negotiation, mediation, Adjudication and Arbitration offer more efficient and flexible approaches for managing disputes in civil engineering contracts. Compared to Litigation, these mechanisms can reduce resolution time, minimize costs and preserve working relationships. However, the selection and effectiveness of ADR methods largely depend on the perspectives and interests of different stakeholders, particularly contactors and consultants.

This study aims to identify the primary causes of disputes in civil engineering contracts in Sri Lanka, examine the factors influencing the selection of dispute resolution methods, and evaluate the most effective ADR mechanism from the viewpoints of key stakeholders.

The research was conducted in three phases. First, a comprehensive literature review was undertaken to explore the ADR framework within the Sri Lankan Construction industry. Second, three detailed case studies were analyzed, focusing on claims associated with quality, time and cost. Third, in depth interviews were conducted with professionals representing contractors, Consultants and Clients. The findings from the case studies and interviews were

analyzed to identify significant differences in stakeholder perceptions regarding dispute causes and ADR selection.

The results provide valuable insights in to the origins of construction claims and the decision making processes behind ADR method selection. This research contributes to improving dispute management practices and offers practical recommendations for construction professionals, policy makers and researchers seeking to enhance dispute resolution effectiveness in Civil engineering Contracts in Sri Lanka.

Key words : Alternative Dispute Resolution (ADR), Civil Engineering Contracts, Effectiveness, Construction Projects, Negotiation, Mediation , Adjudication, Arbitration.
